Challenges in Traditional AHU Systems

01

Low Efficiency of AC Motors

02

High Transmission Loss in Belt Drive Systems

03

High Maintenance Cost of Traditional Fans

04

Hygiene Dead Zones Lead to Secondary Contamination and Impeller Imbalance

05

Inefficient Speed Control Methods

06

Excessive Dynamic Pressure Loss with Legacy Fans

07

No Backup Fan Leads to Costly Downtime

08

Difficulty in Lifting and Installing Large Traditional Fans into Equipment Rooms

09

Lack of Responsive and Flexible Control Feedback

Seemtek EC Fan Retrofit: Proven Solutions

Upgrade with Achelus EC Fan

- Low energy consumption
- High efficiency flow path
- Easy installation
- Maintenance-free
- N+1 redundancy
- No dust dead zones

Higher Efficiency with EC Fan Technology

Advanced EC motor efficiency
Aerodynamically optimized impellers
No belt-driven losses
Lower dynamic pressure loss

Increased Reliability and Redundancy

Redundant fan configuration reduces failure risk

Hygienic, Maintenance- Free Design

Sealed bearings and self-cleaning structure

Smart Control and BMS Integration

Modbus-ready and easy to integrate with energy management systems

Fast and Simple Installation

Pre-engineered modules for quick deployment

Energy efficient of Seemtek EC fan.

Seemtek AHU retrofit help you save money and resource.

Smart Fan Wall System Architecture

Solution Matching –
Powered by Selection
Software

Tailored selections based on HVAC experience and EC fan characteristics to ensure optimal performance.

Achelous
Series
EC Fans

Features three-dimensional blade design and high-efficiency EC motors, reaching up to 68% fan efficiency.

Control
System

Group control logic enables real-time performance feedback, constant airflow or static pressure regulation.

Structural
Modules

Quick-assembly design with reserved space tolerance ensures seamless on-site integration, saving labor hours.

From Evaluation to Execution: 4-Step

01

On-Site Measurement & Assessment

Our experienced technical team will visit your facility to conduct precise measurements of airflow volume, static pressure, and current energy consumption. This thorough assessment forms the critical foundation for an accurate and customized retrofit solution that aligns with both performance goals and budget expectations.

02

Energy Saving Proposal

We develop a detailed proposal tailored to your industry's requirements, highlighting expected energy savings, return on investment, and operational improvements. The proposal addresses existing system pain points and outlines how Seemtek's EC fan solutions will optimize efficiency and reduce maintenance burdens.

03

Project Execution

Our implementation includes step-by-step dismantling of the outdated equipment, installation of the modular frames, precise wiring layout, and integration of EC fans and controls. We coordinate with facility managers to minimize disruption and ensure that every phase meets safety and quality standards.

04

Commissioning & Handover

Once installed, our team performs comprehensive commissioning to validate airflow, pressure, and control performance. We connect the system to your Modbus-based EMS and conduct live testing. A full handover report with documented performance ensures the project's success and your peace of mind.
